Lagos, Nigeria · Remote (UTC+1), 3+ years working across EST & PST

SUMMARY

Senior full-stack engineer with 6+ years at early-stage startups, owning products end to end: architecture, infrastructure, shipping and reporting to founders. I designed the identity-resolution algorithm behind 80%+ of one company's revenue, and I helped rebuild the flagship product behind a \$500K funding round. I recently built and launched **KuttI**, an AI-powered user interface customization layer that lets end users reshape any web app's interface with natural language, in real time and without code changes. Strongest in TypeScript, Node.js, React, PHP/Laravel, AWS, Postgres, distributed data pipelines and production LLM integration.

EXPERIENCE

Founder & Engineer | KuttI (AI-powered UI customization layer)

Apr 2026 - Present

One script tag gives any web app a prompt box. Users type things like "remove the analytics card" and the interface changes instantly, with no page refresh, and it stays that way. Live demo at kuttI.xyz.

- Designed and built the whole product solo: client SDK, AI planning pipeline, hosted backend, docs site and landing page.
- Built a **vanilla JS interception layer** that applies changes to the DOM before paint (no flicker), and a **React runtime integration** that hooks into the fiber reconciler so changes don't fight React's re-renders.
- Built the LLM pipeline that turns a prompt plus page structure into structured, validated, reversible patches, and degrades gracefully when the model makes a mistake.
- Built a Go proxy that keeps LLM API keys out of the browser, plus **locked regions** that protect pricing tables, legal text and other critical UI from edits.
- Shipped as a CDN script tag and an npm package (Vite, webpack) with a 5-minute quick start. Now onboarding early-access teams.

Stack: TypeScript, React (fiber internals), Go, LLM APIs, structured output, npm / CDN distribution

Senior Full-Stack Engineer | Turing (client: US startup, California), Remote

Mar 2024 - Jul 2026

Core member of the engineering team that owned the architecture and delivery for the flagship product rebuild that helped close a \$500K funding round.

- Helped rebuild the legacy CMS from scratch and migrate production to it with zero downtime and no manual steps. The new platform powered the features demoed to investors.
- Replaced Elasticsearch with purpose-built search infrastructure. This cut thousands of dollars a year in costs and made search faster.
- Designed and shipped a subscription billing platform on Stripe, covering plans, webhooks and lifecycle handling.
- Designed multi-region AWS infrastructure. Set up Dockerized deploys with GitHub Actions CI/CD for automated tests and zero-downtime releases.
- Planned my own sprint work, reviewed teammates' code and wrote weekly technical updates for the CEO and investors.

Stack: PHP/Laravel, JavaScript, PostgreSQL, Redis, AWS, Docker, GitHub Actions, Linux

Full-Stack Engineer | Adsit Digital LLC, Virginia, Remote

May 2023 - Jan 2024

Identity-resolution SaaS that processes billions of records every week.

- Designed and built the core **identity-resolution algorithm**. It became the product's main differentiator and generated **80%+ of company revenue**.
- Designed the distributed processing system that handles **billions of records a week** across Linux workers and S3. I built the full orchestration layer.
- Built a high-throughput RabbitMQ pipeline with retries, dead-letter queues and monitoring.
- Cut API latency from **500ms to under 100ms** with query tuning, indexing and caching.
- Built authenticated, rate-limited data-export webhooks for customers. My data-modelling patterns became the team standard.

Stack: Node.js, TypeScript, React, MySQL, MongoDB, RabbitMQ, AWS, Docker, Python

Software Engineer | Arraund Technologies, Port Harcourt, Nigeria

Dec 2020 - Nov 2022

Multi-tenant e-commerce SaaS.

- Designed the event-driven microservices backend from scratch, including service boundaries, messaging and data consistency.
- Built versioned public REST APIs with auth and rate limiting, plus RabbitMQ workflows for orders and notifications.
- Integrated Paystack payments with idempotent webhook handling. Designed multi-tenant MySQL schemas for performance.

Stack: Node.js, JavaScript, React, MySQL, RabbitMQ, AWS

Junior Software Engineer | JS and N Farms, Port Harcourt, Nigeria

Jan 2019 - Feb 2020

- Built an internal ERP system (inventory, sales, live dashboards and automated alerts) that replaced manual Excel-based processes.

SKILLS

Languages: TypeScript, JavaScript, PHP, Go, Python, SQL

Frontend: React (including reconciler/fiber internals), DOM APIs, SDK & library design

Backend: Node.js/Express, Laravel, REST APIs, microservices, Stripe & Paystack

AI: OpenAI & Anthropic APIs, tool calling, structured output, agent workflows, RAG, embeddings, pgvector, Pinecone

Data & Messaging: PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch, RabbitMQ, SQS, WebSockets

Infrastructure: AWS (EC2, Lambda, RDS, S3, SQS), Docker, Linux, GitHub Actions CI/CD

EDUCATION

B.Eng. Electrical & Electronics Engineering, Rivers State University, Nigeria (2016 - 2021)
